(54) Title: PHORETIC DISPLAY DEVICE WITH LIQUID CRYSTALLINE SUSPENSION MEDIUM, AND MANUFACTURING METHOD

(57) Abstract: A phoretic display device comprising a plurality of electrophoretic or magnetophoretic cells, each having a phoretic particle (6) dispersed within a suspension medium (7) comprising a liquid crystal material (20). The phoretic cell is adapted to induce defects (21), sometimes known as disclinations, in the alignment of the liquid crystal material (20) within the cell which act to exert a retentive force on the phoretic particle (6) when within the region of influence of the defects (21). The configuration of the display introduces a threshold level in the electric or magnetic field required to move the phoretic particle (6) between defects (21) within the cell. Accordingly, the non-linear electro-optic or magneto-optic behavior of the display facilitates matrix addressing of the cells therein. The display may comprise a plurality of prolate spheroid phoretic cells arranged in an encapsulant the major (long) axis of each cell arranged substantially perpendicular to the plane of the display.
